Gas Supply:

- Check to make sure that gas mains are turned on. Check inlet pressure and manifold gas pressure to heating equipment to make sure it is properly set.
- Check gas regulators to be certain regulator vents are not plugged.

Gas Controls:

- Inspect all gas connections for good tight fits. This includes pipe connections to the equipment as well as pilot tubing connections at the gas valve and at the pilot burner.
- Inspect the main burner gas orifices to make sure they are not blocked with spider webs. Check pilot orifice for obstructions if pilot cannot be lit or will not stay lit.
- After visual and physical inspection of the gas connection, turn on the gas and check for gas leaks using a water/soap solution.

DANGER! (Do not check for gas leaks with an open flame.)

Gas Burner:

- Inspect the burner for general cleanliness. If the burner requires cleaning, clean with a stiff brush (not a wire brush).
- Inspect inside of burner tubes as much as possible. During the summer months it is not uncommon to find that insects or rodents have nested inside the burner.
- Inspect burner for proper location making sure that it is properly aligned and securely fastened.

Air Movers:

- Lubricate motor bearings if they are not the permanently lubricated type.
- With the power turned off, check to see that the motor shaft turns freely and does not bind. This can be done by rotating the fan or blower wheel by hand. Inspect the fan or blower wheel to make sure they are not damaged or binding.
- Check to make certain fan is not loose on motor shaft. If blower units are used, make certain the blower and motor pulleys are secure.
- On blower units, check for proper belt tension and also look for signs of belt wear.

Note: Equipment using belt drives should have the belt tension checked periodically during the heating season to ensure continued proper operation.

Condensate Removal:

Gas-fired condensing units, check the following items:

- Make sure the condensate lines are clear of obstructions and free flowing.
- Assure the condensate drain line "P" trap has been primed and filled with water.
- Check the condensate overflow switch to make sure it is working properly.

Vent System

- Check to make certain vent system is clear and free of any obstructions.
- Be sure all connections are secure and tight.
- Inspect the entire vent system for signs of corrosion, damage, and all potential issues that could lead to vent products entering the heated space or vent products recirculating into combustion air.

- Clean vent pipe and clean out cap, if necessary.
- Make certain vent support system is secure and free of damage.
- Check joints of vent for signs of condensate leakage. Water marks down the outside of the vent pipe may indicate inadequate venting and/or improper vent insulation in unheated spaces. If water marks are observed, double check to make certain the proper vent system has been installed.
- If units are the power vented (power exhaust) type, check all the wiring connections to the power venter motor, and the vent system safety pressure switch.
- Check the pressure switch sensing tube for blockage or damage. With the main gas turned off, cycle the thermostat to check the operation of the power venter, and verify the safety pressure switch is functioning.
- Check the exterior components of the vent system (exterior vent extensions, vent weather caps, combustion air intake weather caps, etc.) to assure they have not been compromised, they are in proper position, and that there are not any blockages at the air intakes or vent discharges of the venting system.
