* Line Item number 48, Radioisotope fume hood, model # 5-0074-2L, requires certification both with and without flow through the HEPA filter as indicated in the specifications. The 4 ft Keavaunce fume hood has an "Airflow Supreme Filter Housing", Model No. 900 Filter Housing. It is designed to use with one (2 inch) thick pre-filter and one (11 1/2 inch) thick high efficiency (HEPA absolute type) filter. The filters are 24" X 24". Part # 853 & 854

Charges for the following testing performed on fume hoods includes the cost to inspect and certify as noted above
Please Note: For the hood in the basement, item # 48, the agency analyzes environmental samples (mostly water) in the fume hood located in room B27 that contains nitric acid and trace amount of metals hence HEPA filter was made available as an option for trapping the particulate types of radiation. Although this HEPA filter was installed as a shunt to the main air outlet vented on the roof of the laboratory building, no absolute or charcoal filters are used. Once a year, the ventilation efficiency of the hood should be tested and logged in the radiological survey log (located on the outside of the hood).

It should be noted that only in the occasion of a radiological emergency the agency is required to close the gate that controls the exhaust flow and open the gate to the diverted flow that goes through the HEPA filter to the scribed line.

Hood 140-1 does not use chemicals at all
163-1 uses acids
163-2 acetone
137A-1 metals and acids
